

OOP PROJECT

Airport Management System

A C++ program with OOP Concepts

PRESENTED BY:

Rabeesha Ijaz (24P-0015)
Khansa Malik (24P-0019)
Warda Shahid (24P-0007)

Introduction to Our Airport Management System

In our project we have designed an airport management system that works on the principles of Object Oriented Programming. The program works on 6 classes i-e:

- class Airport (base class)
- class Flight (derived from class Airport)
- class Airline
- class Staff (derived from class Airport)
- class Baggage
- class Passenger (derived from class Airport)
- class Ticket (derived from class Passenger)

Functionalities Of Our Airport Management System

In this Project the program has the following Functionalities on which it works and operates as a Airport Management System:

- Storing the details of Airport .
- Having all Flight details such as destination, departure and arrival timings etc.
- Airline details and the flights of respective airlines and the number of flights each airline has.
- Managing all details of the staff of the airport and having the functionality to assign them tasks and keeping a track of them.
- Having track of the passengers of the Airport and their details.
- Keeping note of the Baggage of each passenger.
- Managing tickets of the passengers.
- Booking and Cancelling Tickets.
- Registering Passengers , checking in , checking available seats.

Concepts Of OOP Used

The following complex concepts of Object Oriented Programming are used in Our Airport Management System Project

Aggregation

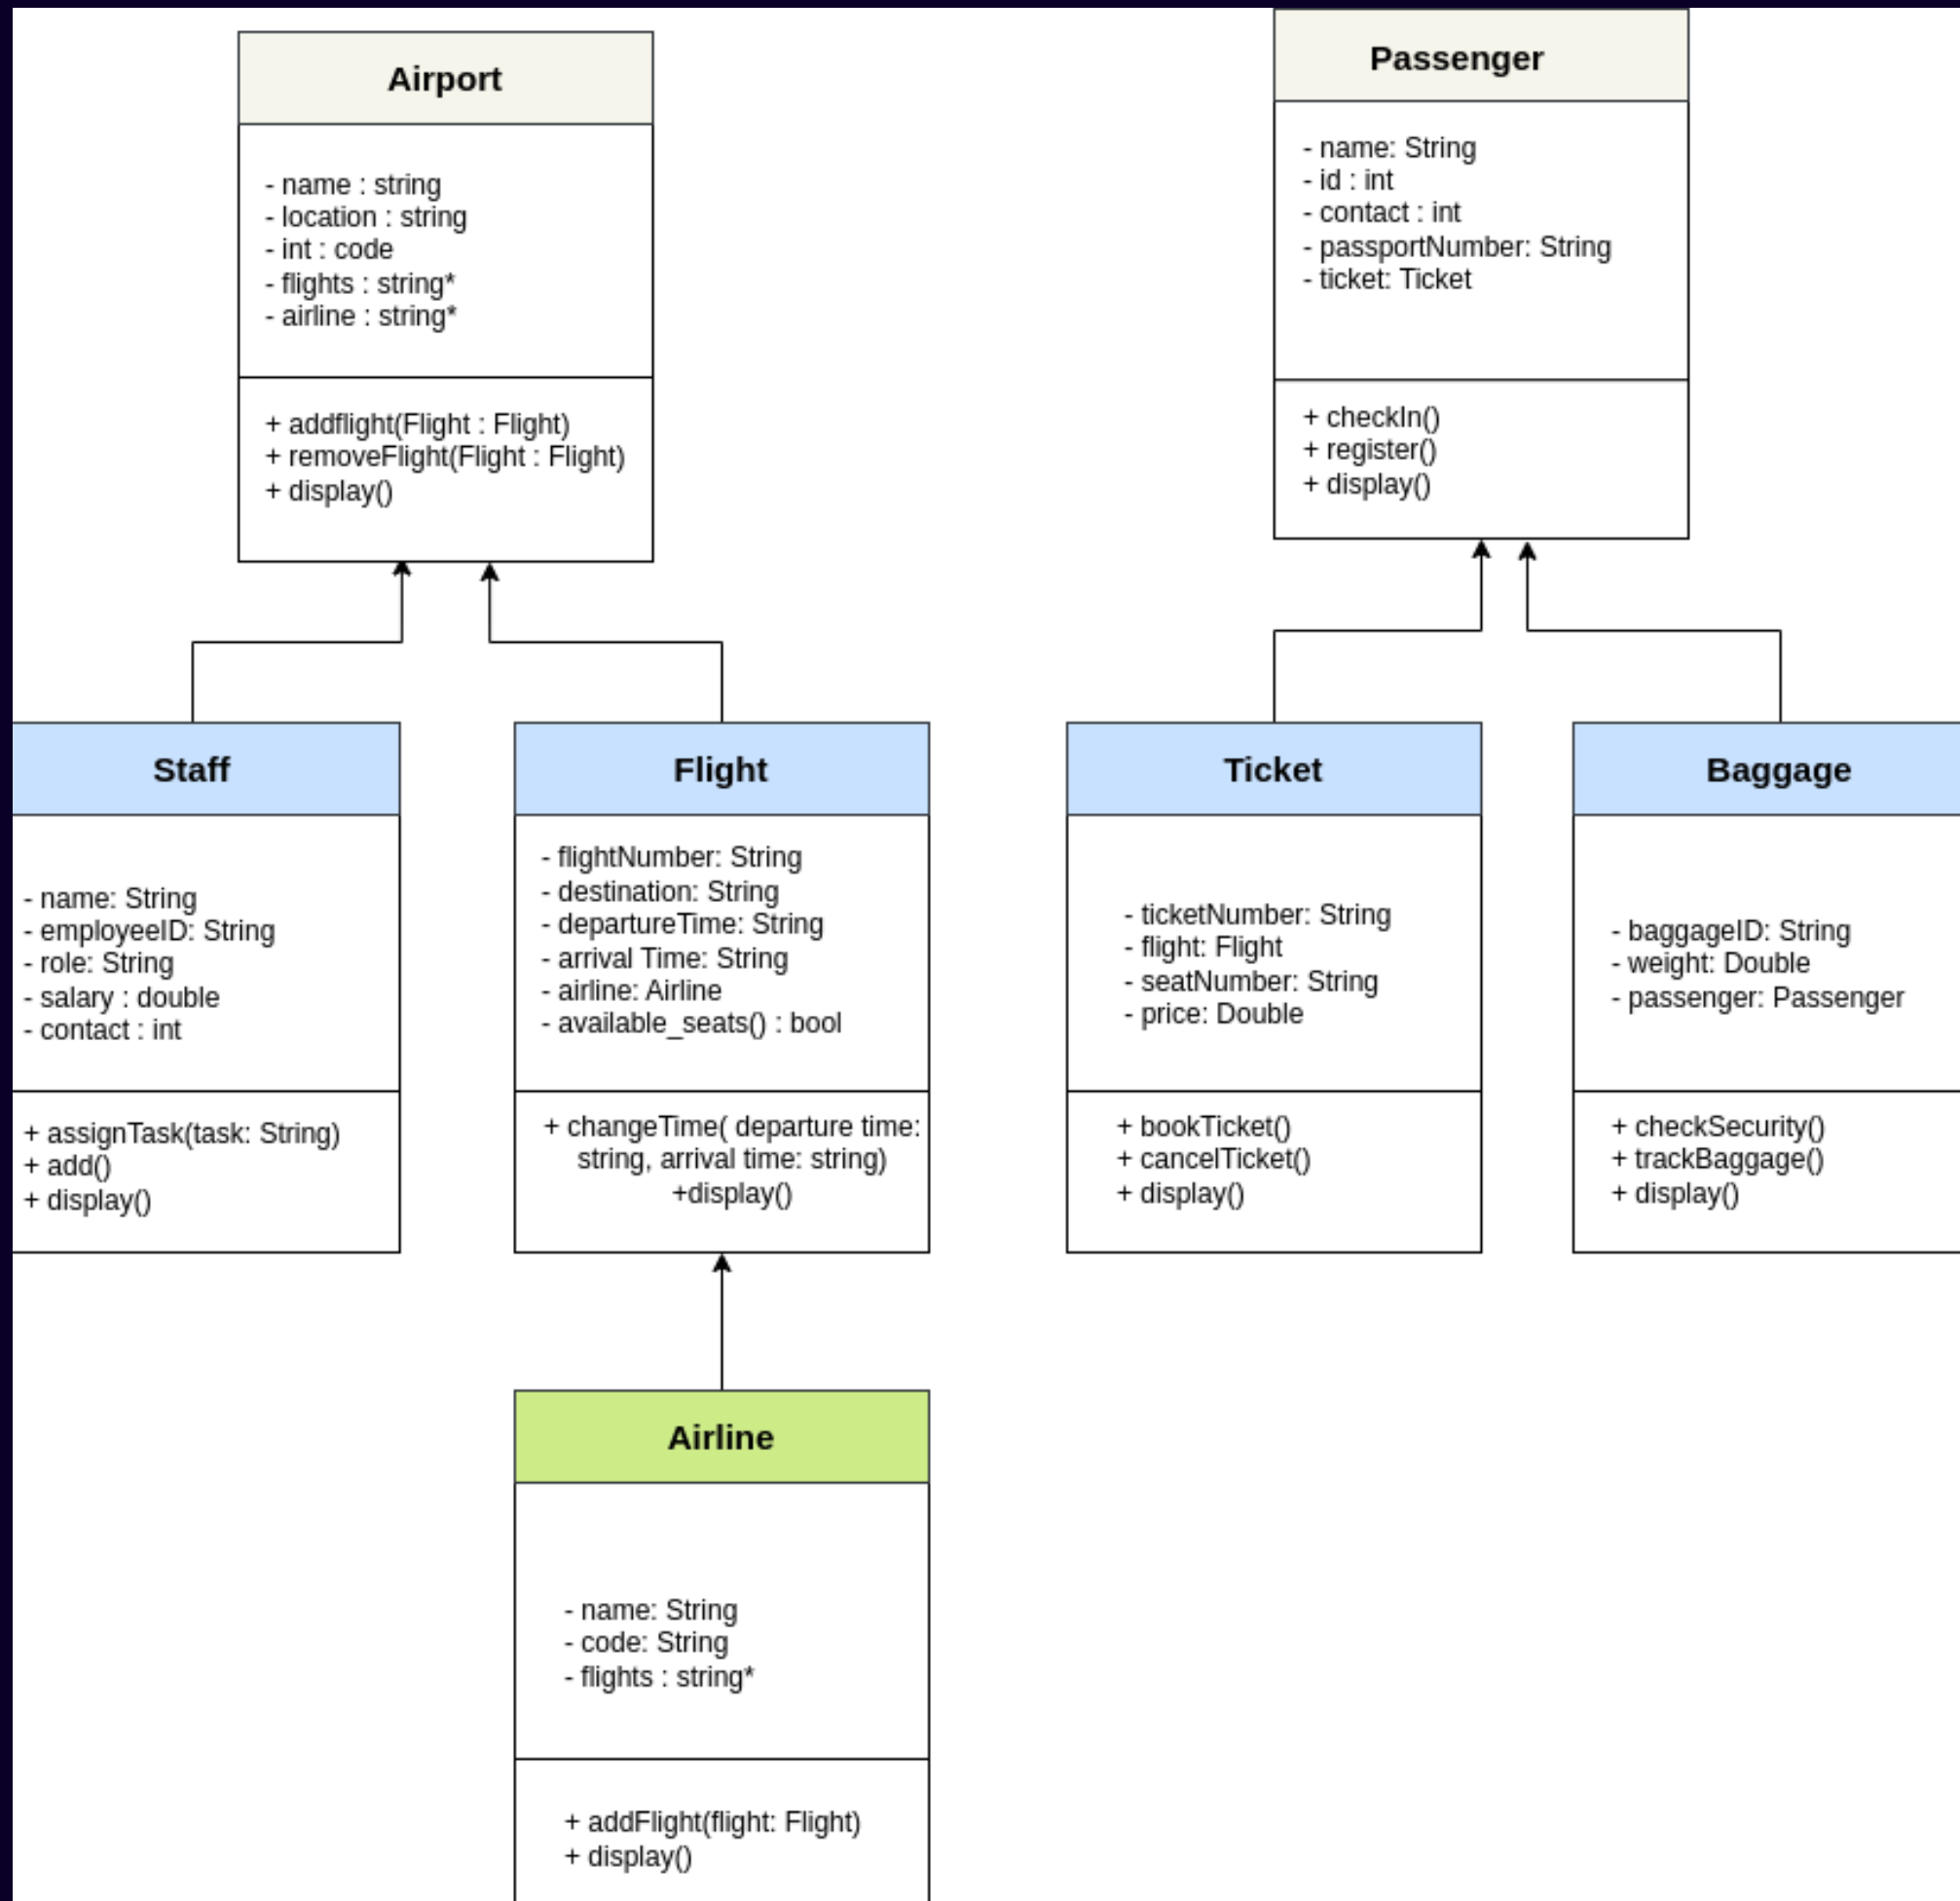

Polymorphism

Inheritance

Composition

Friend Class

Class Daigram

OOP PROJECT
